Day 2: Practice Tasks for Your Project

Task 1. SWOT Analysis

Below is the classical SWOT analysis table. What makes this one different from most others is the approach to completing it: instead of nice clichés and a *"dream story"*, use **what you actually heard during the Day 1 interviews**.

We encourage you to answer honestly: this is not the pitch deck you will use to impress your investors; this is the analysis that will help you decide where to lean in and where to protect your focus. If you skip this step now, you risk paying for it later.

Ask yourself the following questions to complete the corresponding sections:

Strengths:

- *What did people say we are genuinely good at?*
- *Does our team have real expertise in this space?*
- *Do we have access to users, data, or distribution that others don't?*
- *Is our value proposition clearer than the typical vague "AI for everything" pitch?*

Weaknesses:

- *What was hard to explain during interviews?*
- *Which critical skills are missing on the team? Technical? Sales? Domain knowledge?*
- *Are we trying to cover too many use cases at once?*
- *Are we relying too heavily on one person, one dataset, or one assumption?*

Opportunities:

- *Are there strong tailwinds - like new regulations, AI adoption, remote work trends?*
- *Did you identify a segment where current tools just don't cut it?*
- *Did someone mention a related problem they'd love to solve next?*

Threats:

- *Is a big platform gearing up to enter your space?*
- *Are there trust, privacy, or security concerns you must handle?*
- *Are your users locked into old workflows or long-term contracts?*

Strengths - internal advantages you already have	**Weaknesses** - internal gaps or limitations
* I'm a software developer and early implementer of Agentic Coding - which allows me to move fast. * I have a network where I can get specialist input from the fields of computer science, design, marketing, education, entrepreneurship and business. * The value proposition is clear, the direct selling-point is not AI, but to deal with a real problem, not just for individual users but in overall society. * People have said that they are genuinely interested in a solution like this for their children, and they see the need.	* Currently I'm a 1-man team, and I already have a full-time job. It is hard to find enough time. Time is a big limitation. * For the product I am in need of another software developer and a designer - who both care about the mission. (I currently have these as collaborators, but I need them full-time). * I am covering too much at the same time, I have several use cases. It is currently not obvious which one I should hone in on.
Opportunities - external forces you could benefit from	**Threats** - external factors that could slow you down or block your idea
* There's a big worry about shortened attention span, harmful content in the form of websites like TikTok + and pornographic websites. * There's a problem with AI being used by students for cheating rather than for learning. * I have contact with teacher/educator networks (both in the US and Europe) - that can be used to find clients. * Current tools act like blockers, but they are either insufficient, or they block too much. My application has a significantly different design and finds the sweet spot.	* A big target group for me is school and education institutions. They are tight on budget. However, my application is not competing against previous workflows - and can therefore be adopted with less friction. * Since the application target K-12 students, there's a privacy concern that needs to be handled correctly.

The real insight comes when you start looking at how things connect. After completing the table, look at the following intersections:

S × O: When your **Strengths** meet your **Opportunities** - this is where you double down:

- Agentic Coding/Fast development + Changing school needs because of AI wave.
- Genuine interest + Current tools are insufficient.

W × T: When your **Weaknesses** meet your **Threats** - this is where the risks live *(meanwhile, it is not a reason to panic; use these signals to make informed decisions)*:

- Lack of resources. (1-man team + [privacy concerns + potentially tricky sales)]

Task 2. Business Model Canvas

Complete the canvas below based on *"From Fantasy to Reality: The Business Model Canvas"* part of the Day 2 lecture.

Key Partnerships	Key Activities	Value Proposition	Customer Relationships	Customer Segments
I depend on my network with Educators to reach out to users.	A kiosk mode application removing distracting and harmful media. A user must be able to create a session, and give it to another user.	Remove harmful and addictive content from desktop and make it focused on learning.	I have contact with Educators, School founders, decision makers.	I am building for K-12 students who use computers for studies. At home and, or in school.

	Key Resources * Database(authentication + data collection) * Website * (Analytics)		Channels Main channel is to reach customers through Educators+Teacher networks.	

Cost Structure The running costs are small. We need a webpage (little to no startup costs) + database (little to no startup costs). Currently, there's no LLM's involved, so there's little to no API costs.	Revenue Streams I will get revenue from subscriptions. B2C (specifically to teachers/parents), and B2B (school wide).

Task 3. One-Pager

Use the next page to create the shortest, sharpest version of your startup story. Below we provide a structure you can follow *(however, you don't have to stick to it word for word; feel free to adjust it according to your project)*:

1. **Problem and Context**

Students are constantly exposed to distractions and harmful content with unrestricted browsing when they want to focus on their studies. The current parental-controls are either too fragile or too restrictive.

2. Solution and Value Proposition

We provide a kiosk-mode learning environment with a browser and workspace that shelter the student from distractions and harmful content, so they can stay focused and engaged.

3. Target Customer

The target users are K-12 students, that use computers for their studies. The target customer are their parents or teachers.

4. Evidence

Teachers telling me they wanted to support the idea and to be early testers together with their students. Parents saying they would be interested in the tool. Decision makers in the education field seeing how this application could help with various problems in Education, and offering help for me to reach out through their networks.

5. SWOT Highlights

Strengths + Opportunities:

Agentic coding - will significantly speed up development.

There's a high need, especially with unrestricted AI chat's in schools, for a tool that make that cheating option less feasible.

There's an overall big push toward making technology more suitable for students (A recent big topic and worry has been circulating around the term "brain-rot").

Weaknesses + Threats

Lack of resources. (1-man team + [privacy concerns + potentially tricky sales)].

6. Business Model Snapshot

I plan to reach my customers through the channel educator/teacher/school networks.

Early stage-costs are minimal, and will scale linearly as my customer base increase. The initial launch will focus on B2C, so that we can get early adopters and testers. The next phase will be to focus on B2B, where we sell school-wide licenses.

Market size: There are roughly than 100 million devices used by K-12 students in Europe + USA.
