Day 3: Practice Tasks for Your Project

Task 1. Your Focus Sentence and Experiment Hypothesis

Complete the following sentences:

1. Our product does **ONE** thing perfectly: it helps **students** to achieve **sustained focus on their studies or project** by using **our kiosk-mode browser designed to remove distractions and harmful content**.

2. If we give **students** a way to **remove all possible distractions**, they will **sustain focus on their task**.

Task 2. Measure What Matters

Use the table below to define your **key and supporting metrics**.

Instructions:

- **Key Metric:** The single most important metric indicating your product is delivering value (e.g., completed lessons for a learning app).
- **Supporting Metrics:** 2-3 metrics that help you understand your funnel and customer health (e.g., activation rate, retention, cost per acquisition).

Review these metrics **weekly or monthly** to guide decisions on where to double down or adjust focus.

Metric	Why This Metric Matters *e.g., Shows core value delivered to customers*	How You Will Measure It *e.g., From product analytics and user feedback*	Current Value	Target Value	Notes / Actions
Sustained focus	App must help students stay focused.	Active time in application.	0	90min	Active time spent in application translates relatively well to “sustained focus”.
More efficient study.	Application should make studying more efficient.	Questionnaire	slower	Faster	Question when finished session: “How did [application] impact your efficiency”: “Slower” | “Same” | “Faster” —> “How could the application help you be more efficient?” —> Text box
User experience	Students should enjoy using the application.	Questionnaire	0	5	Question when leaving session: “How was your session?”: 1|2|3|4|5 —> “How could it be improved” —> Text box

Tip: If a metric isn’t driving decisions, consider dropping it to reduce noise and maintain focus.

Task 3. Execution Roadmap

Use the table below to map your MVP execution.

Instructions:

- **Milestone:** A clear step in your MVP build (e.g., “Launch alpha to 10 users”).
- **Objective:** The specific result you aim to achieve (e.g., “Validate core feature usability”).
- **Resources Allocated:** How much time, budget, and team effort you will dedicate.
- **Success Criteria:** How you will measure success for this milestone. (e.g., “At least 5 users complete the core workflow and report value”).
- **Deadline:** The target date for completing this milestone.

Milestone	Objective (Outcome to Achieve)	Resources Allocated (Time, Budget, Team)	Success Criteria (How You’ll Know It’s Working)	Deadline
1. Launch alpha to 5 goodwill (friends and family)	Get second opinions + catch obvious errors + initial sense of a user flow.	1 week.	Feedback through conversations: “Is the idea any good?“ Push for honest feedback.	March 16
2. Make application more robust + make relevant alterations.	Make sure the core functionalities work well. Improve user experience.	40h. 1 person, part time. Two weeks.	Main application works smoothly and looks clean.	April 6
3. Launch beta version to 10 relevant users, through founder’s network.	Get feedback from real, domain specific users.	2 weeks	Feedback through conversations: “Can you see yourself using this application?” Push for honest feedback.	April 20

4. Make application more robust + make relevant alterations.	Add necessary features.	80h. 1 person, part time. 1 month.	Integrate analytics + feedback inside application.	May 18
5. Launch application to a wider audience. 50+ users.	Get feedback from users, based on metrics defined in previous section.	1 month +	Feedback through metrics defined in previous section.	June 15th -> + continuous

Task 4. Sales Pitch

Based on everything you learned during Days 1-3, draft your 5-minute sales pitch script, sticking to the following structure *(remember: it differs from your investor pitch; use this one for your next user conversations)*:

- **Problem:** Make users feel the pain *(60 seconds)*

Over the last decade, there's been a significant increase in distracting and addictive applications in technology; Games, Social Media, Reels and constant notifications. The new currency of the 21st century is our attention, and the most affected, with dire consequences, are the younger generation.

School students need to use computers and the internet for learning, but their attention is easily hijacked by various addictive applications.

- **Solution:**

Our solution is a browser with a focus mode, which locks the student within a learning session - making it impossible for them to navigate to distracting and addictive websites or any other harmful content on the internet.

- **Demo:** Show the core feature live, if possible. If it's not ready, walk through the ideal version *(3 minutes)*

We have a demo, but the gist of it is: We have a normal web browser, with a “Study Mode” button, which lets the user quickly create a focus session with the tabs conducive to learning. When the user enters this focus session, a kiosk mode opens up, where URL bar is disabled and web search is highly filtered.

Depending on how the focus session was created, the user will either be locked within the session with a timer, or experience high friction in leaving the session.

- **Social Proof:** Share who else is interested, demonstrate early results - anything that

gives pitch credibility *(30 seconds)*

We have pitched this idea to parents, teachers and teenage children - showing interest in using and purchasing this solution.

This version of your pitch is a **conversation starter**. Use it, then adjust based on what you hear.
